

# LOGISTICS PLATFORM

*Logistics platform , Hauts-de-France region*

<b>END CUSTOMER</b>	Logistics platform of a major European group
<b>LOCATION</b>	Hauts-de-France region
<b>OBJECTIVE</b>	Securing warehouses, controlled access to the site (pedestrians and vehicles), remote access management
<b>PROPOSED SOLUTIONS</b>	Video surveillance system with dome AHD cameras, bullet and speed dome + cards, badges, suction cups, readers and central access control + software + hard drives, monitors
<b>CONTRIBUTORS</b>	Securinor (Installer)

## A GIGAMEDIA VIDEO SURVEILLANCE AND ACCESS CONTROL SYSTEM ON A LOGISTICS PLATFORME

### THE RENOVATION PROJECT

Last month, Securinor, a specialist in protection and access control solutions for the business sector, began equipping one of the warehousing sites belonging to a major European logistics group with Gigamedia security products.

This first site, based in the Hauts de France region, forms part of a network of hubs in France and throughout Europe, spread across major conurbations. This network specialises in logistics, transport and delivery of products originating from various business sectors (fashion, cosmetics, high-tech products, home furnishings, etc.).

The task was as follows: warehouse security, video surveillance and access control for the site (for both pedestrians and vehicles), remote access management.

## GIGAMEDIA'S CONTRIBUTION

The products proposed by Securinor and the brand specifically provide remote and low cost access management to this logistics platform, as well as **protection of the site** (Secure entry, management of visitor movements, employee attendance monitoring). The solutions implemented by the installer provide the perfect responses to numerous **access control and surveillance constraints**.

Gigamedia video solutions are able to monitor premises on-site or remotely, using smartphone applications in particular. The different cameras put in place (**dome, bullet and speed dome cameras**) can be easily adapted to various installation positions (walls, ceilings, posts, etc.) and the configuration of the premises under surveillance.

The system, comprising readers, controllers, hard drives, monitors and cameras, guarantees around the clock surveillance and protection of both external and internal spaces. The recommended **AHD technology** transmits clearer images with no latency or flicker and colours are better reproduced.

Easy to install, AHD offers outstanding value for money. This technology is compatible with existing cabling, thereby protecting previous investments, as AHD DVRs are able to record both AHD feeds and those originating from first generation analogue CCTV cameras.

The software used for the centralised access control solution enables the system to be managed thanks to an **intuitive interface and advanced functionalities**. Complete and customisable, it manages up to 15,000 users and enables **multi-site and multi-position systems** to be created. Above all, it offers the option of combining **access control, video surveillance and intrusion in a single web interface**. Available in several languages, it is suitable for SMEs as well as international groups. In this respect, Gigamedia cards, badges, electromagnetic locks and electric latches make up a complete and scalable system.
